RIGHT FUND Annual Report 2019-2020

재단법인 글로벌헬스기술연구기금

KEYNOTE

"Korea achieved remarkable outcomes on the development of new formulation and manufacturing in therapeutics and vaccines and gained a competitive edge in the global market. Korea's technological strength can play a key role in removing public health challenges in developing countries."

Dr. Paul Herrling, Chairman of the Selection Committee, RIGHT Fund & former vice president of the board of the Swiss Federal Institutes of Technology, at an interview with Korea Biomedical Review in April 2020.

"When Korea's strengths in life science technology are applied to meeting the needs of developing countries, it will lead to a significant improvement of global public health."

Dr. Andrin Oswald, former Director of the Bill and Melinda Gates Foundation, during an interview with Yak-up newspaper in November 2019.

"A global public-private partnership, like the RIGHT Fund, must be further expanded and strengthened to promote health equity." Younbeen Kim, CEO of the RIGHT Fund, at Developing Countries Vaccine Manufactures Network Annual meeting in October 2019

In anticipation of the role of Korean strengths in improving global health

Technological advancements are bringing about astonishing worldwide changes every day.

Diseases that have long caused tremendous misery are coming under control thank to developments in bioscience and biotechnology. However, such benefits are not yet evenly distributed to all of humanity. Many elements of healthcare technology that we now take for granted are not yet available and affordable in low-resource countries.

Korea has achieved rapid growth in the fields of bioscience and biotechnology—with particular strengths regarding drug formulation development, vaccine manufacturing technology, and ICT combined diagnostics—which could have rapid and substantial positive impacts on patients in the developing world. We are confident that the application of Korea's technological strengths towards global health

> CHAIRMAN OF THE BOARD CHANGJIN MOON

will improve worldwide healthcare access, which is essential in low-resource countries, representing a great step towards solving the problem of human health inequalities. The RIGHT Fund will play an important role in making this goal a reality.

In a major step forward, the RIGHT Fund was successfully launched in 2018, and made its first investments in 2019.

In 2020 and onward, the RIGHT Fund will increasingly focus on seeking investment opportunities with immediate impact, and identifying prospects for expanding Korea's contribution to solving global public health issues, which includes the introduction of the Technical Accelerator Award to support proof of concept of innovative research projects. Keep an eye out for our future updates and developments!

> CEO & EXECUTIVE DIRECTOR YOUNBEEN KIM

71 201

Research Investment for Global Health Technology Fund

The RIGHT Fund, established in July of 2018 and based in Seoul, South Korea, is a research funding agency dedicated to supporting global health R&D through a three-way partnership between the Government of Korea (GOK), Korean life science companies, and international funders. The RIGHT Fund provides a platform for the GOK and Korean industry to increase their contributions to global health, and will serve as a vehicle for investment in R&D projects aimed at delivering tangible products to address disease burden in developing countries. The goal is to advance the discovery and development of new health technologies to meet the needs of low-income countries by leveraging the intellectual, technological, and financial resources of Korea.

Mission

countries.

To mobilize Korea's innovation and leadership to

advance global health equity by promoting the

discovery and development of new technologies that will meet the public health needs of developing

Vision

To alleviate the burden of infectious disease that disproportionately affect the people in low-resource countries.

Funding Partners

Investment Area

Target Diseases

	VACCINES			DIGITAL HEALTH
New Approaches & Constructs	 New vaccines for target diseases New pediatric combination vaccines 	New chemical or biological approaches for currently unmet needs	 New diagnostics and /or those that can improve efficiency of treatments New low cost Point of Care tests 	• ICT applications for patient access tools or surveillance
Product Improvements	• Improvements in immuni- zation schedule, production method, thermostability, administration routes	 Incrementally modified drugs New treatment regimens and modifications that improve drug uptake and outcomes 	Improvements in existing diagnostics for use in low- resource countries	Improvements in existing digital health platforms for use in low-resource settings
Patient Access	 Seeking or nearing WHO Pre-qualification Lower-cost manufacturing platforms 	 Seeking or nearing WHO Pre-qualification Lower-cost manufacturing platforms 	• Lower-cost diagnostic tools for use in low-resource countries	

Type of Award

	Technical Accelerator Award (TAA)	Product Development Award (PDA)
Development Stage	Proof of Concept and Preclinical	Phase I and onward
Project Duration	Up to 12 months	Up to 36 months
Project Budget	Up to 500 million KRW	Up to 4 billion KRW

Eligible Development Stages

Vaccine & Therapeutic

Diagnostic &

Digital Health

Technical Accelerator Award Scope

Infectious diseases endemic and emerging primarily in developing countries

Phase II		Phase III	Registration
n	Clinical	/alidation/Utility	Registration
/11 	Cinnear		Registration
е	Product Development Award Scope		

RIGHT Fund's Public-Private Partnership

In-taek Lim Director General for Health Industry of MOHW

"The RIGHT Fund represents a new and unique operating model of the Official Development Assistance (ODA) projects by fostering R&D capabilities of domestic life science companies beyond financial aid. A total of 50 billion Korean won has been raised through this public-private partnership for investments towards the development of the essential health technologies in developing countries. While efforts to overcome the current COVID-19 pandemic continue, it is equally important to establish a network of public-private collaborators to support R&D for infectious diseases in a more organized and sustainable way. The RIGHT Fund platform is well positioned and expected to be part of the Korean response to future epidemics."

Andrin Oswald former Director of Life Science Partnerships of BMGF

"Korea is an economic powerhouse and occupies an important position in global health, with its rapid innovations in the fields of bioscience and biotechnology. I believe that precisely understanding and promoting Korea's strengths will accelerate changes in global health. Through the RIGHT Fund, the Gates Foundation wants to work strategically with the Korean government and key stakeholders, to more accurately identify Korea's strengths that can affect global health, and thus promote changes. The application of Korea's strengths in life science technology to meet the needs of developing countries will make a significant contribution to global public health. We hope that more Korean companies will work with the RIGHT Fund on R&D projects, which will ultimately have a positive impact on global health."

Hun Kim CTO of SK Bioscience

"The RIGHT Fund is an ODA platform that leads Korea's contributions to global health by strengthening its R&D base. If the RIGHT Fund can accelerate the formation of a healthy ecosystem in the Korean biopharmaceutical industry, it could establish a strong foundation for our businesses in the future global health market. The RIGHT Fund can also support the growth of Korean technology companies on a global level, through collaboration with leading international organizations. Korean companies currently have strengths in late-stage development processes—such as in the development of low-cost manufacturing technology and formulation before commercialization-rather than in the early research stages. I hope that the RIGHT Fund can help to further build up the infrastructure of Korea's technology strengths, thus improving its position in the global health market."

Jeewoong Son Executive Vice President of LG Chem

"LG Chem's Life Science Business Division is making various efforts to contribute to global health by collaborating with other life science businesses, taking on the mission of "Science and Innovation to Save Life". We hope to further develop the partnerships between various organizations for global health through the RIGHT Fund. Moreover, we hope that the pipeline of the projects supported by the RIGHT Fund will lead to the successful manufacture of products and substantial contributions to global health."

Byung-Wha Kim former Vice President of GC Pharma

"We anticipate that R&D partnerships with Korean companies, researchers, and overseas organizations will be further expanded through the RIGHT Fund, and will promote R&D for improved global health. Additionally, we hope that Korean companies will become more active in global public health R&D, and take action regarding concern for global health through the **RIGHT Fund.**"

Young-Joo Kim President & CEO of Chong Kun Dang Pharm

"Healthcare services are not reliably provided to all of humanity worldwide, with particular deficits in developing countries. The key to improving global access to healthcare is the management of the costs and technologies associated with vaccines, therapeutics, and diagnostics. Solving these problems will require the cooperation of various organizations, including country governments and corporations. We are confident that the RIGHT Funda global public-private partnership that discovers and supports the technologies needed for developing countries by utilizing Korea's innovation, leadership, and strengths-will contribute to the promotion of global public health. Furthermore, we expect that the RIGHT Fund could make significant strides in the development of innovative healthcare technology R&D."

"Developing and disseminating good-quality vaccines in developing countries can afunding to perform the R&D if the profits of a product under development are not guaranteed. We hope that the RIGHT Fund, which pursues the public good based on its social mission, will bring more support from international organizations and governments, to create a force that drives the needed R&D, such as through copayment of development costs. Additionally, we hope that the RIGHT Fund will help Korean companies to do more R&D for global health."

You Suk Suh former CEO of Genexine

RIGHT Fund Portfolio Overview

The RIGHT Fund's investment portfolio consists of a total of 22 research and development (R&D) projects to date which were selected through three times Request for Proposals (RFP). From 2018 to the 1st half of 2020, two Product Development Award (PDA) RFPs and one Technical Accelerator Award (TAA) RFP were executed. The PDA is the standard award that supports mid-to-large scale development projects in pre-clinical stage onwards while the TAA supports development of early stage projects proof-of-concept. RIGHT Fund's current portfolio includes research on COVID-19, cholera, tuberculosis, malaria, hepatitis A, meningococcal infection, leishmaniasis and typhoid fever. The RIGHT Fund's 1st PDA supports 5 R&D projects - 2 vaccines, 2 diagnostics, 1 therapeutic - while the 2nd PDA supports 5 R&D projects which include 4 vaccines and 1 diagnostic. The 1st TAA, launched in early 2020, supports a total of 12 projects, including 5 vaccines, 5 diagnostics and 2 digital health technologies.

2019 PDA Projects

Novel Cholera Conjugate Vaccine eubiologics 🕴 🐻 👿 🛞

cholera vaccine (OCV) among children under 5 years in low-income country settings. This CCV is based on a novel conjugation technology studies demonstrating protection in a neonatal murine challenge model.

This project aims to improve manufacturing efficiency and process optimization of the CCV through a technology transfer from MGH-Harvard to EuBiologics in collaboration with the International Vaccine Institute (IVI) to produce clinical material suitable for pre-clinical toxicity studies and Phase 1 clinical trial.

DTwP-HepB-IPV-Hib Hexavalent Vaccine LG Chem

Combination vaccines provide many advantages including simplification of immunization schedules, fewer number of injections to infants and protection against multiple diseases. LG Chem's fully liquid DTwP-HepB-IPV-Hib hexavalent vaccine has completed Phase 1 clinical trials in healthy adults and is currently in Phase 2 with plans to enter Phase 3 clinical trials in early 2022. LG Chem aims to internalize all components of the hexavalent vaccine in order to secure a stable supply capacity and quality control. This vaccine aligns with the World Health Organization's target product profile and upon successful development it will allow countries experiencing shortages of inactivated poliomyelitis vaccine (IPV) to reintroduce it in their national immunization programs in addition to their existing pentavalent vaccine immunization routine.

Continuous Manufacturing Process for New Antimalarial MMV 🕘 🕘 🔅 💦 bic

Single-Exposure Radical Cure (SERC) drugs are an ideal malarial treatment that can overcome parasite resistance issues and improve treatment compliance. The Medicines for Malaria Venture (MMV) has been pursuing the development of two potential single-dose treatments for malaria, OZ439 and MMV052, both of which require a key intermediate OZ2.

This project aims to develop and scale a continuous manufacturing process for a key intermediate OZ2 used in OZ439 and MMV052. The feasibility of the manufacture of OZ2 by continuous procession has been already established and MMV aims to scale-up OZ2 in collaboration with SK Biotek's continuous manufacturing process technology to meet desired production cost and manufacturing safety

2nd Generation G6PD Test SD BIOSENSOR PATH

8-aminoquinoline drugs, antimalarials, can radically cure *Plasmodium vivax* but can also cause severe hemolysis in individuals with deficiency in glucose-6-phosphate dehydrogenase (G6PD). Thus, the World Health Organization (WHO) recommends testing for G6PD deficiency prior to the administration of these drugs. SD Biosensor has already developed a first-generation quantitative point-of-care (POC) test to measure G6PD levels

SD Biosensor is currently working on a second-generation test with improvements that reduce user-errors and increase product shelflife for better and effective use in remote settings. The updated components of the test will be evaluated by Program for Appropriate Technology in Health (PATH).

POC for Multidrug-Resistant TB Test BIONEER FINDS to International Tuberc Researc ICenter

Only 25% of patients with drug-resistant tuberculosis (DR-TB) globally are diagnosed and properly treated. Also currently available

Bioneer aims to develop and validate a multidrug-resistant TB diagnostic test kit ported on a point-of-care (POC) molecular diagnostic platform for the simultaneous detection of Mycobacterium TB resistant to rifampicin, fluoroquinolones, isoniazid, and aminoglycoside drugs. The analytical laboratory evaluation will be conducted by the International Tuberculosis Research Center (ITRC) and a multi-center clinical evaluation will be conducted by the Foundation for Innovative New Diagnostics (FIND) for the submission of the dossier for the

2020 PDA Projects

Development of a compartmental microneedle array patch (C-MAP) for delivering a pentavalent pediatric vaccine that protects against diphtheria, tetanus, pertussis, hepatitis B, and Haemophilus influenzae type b (Hib) leveraging QuadMedicine's MAP technology platform. The scope of work involves the formulation of each component, assessing immunogenicity, and the production of the MAP. This vaccine offers an effective alternative method in immunization programs with the possibility of overcoming the current limitations of vaccine formulation, delivery, storage and thermostability. Yonsei University will evaluate the immunogenicity of vaccination using C-MAP comparing the immune responses induced by intramuscular injection. LG Chem will manufacture and provide qualified antigens.

The Bacillus Calmette–Guérin (BCG) vaccine has been widely used but provides insufficient protection against tuberculosis (TB). This project aims to develop a prime-boost vaccine strategy that enhances the initial immune response and strengthens the adaptive immune response. This BCG prime-boost regimen consists of an ESX-1Mmar vaccine for priming and a multi-antigenic Rv2299c-ESAT-6 vaccine with a GLA-SE/c-di-GMP adjuvant system for boosting. Chungnam National University College of Medicine is working on the pre-clinical development stage including evaluation of antigenic properties, immunogenicity, and efficacy test in collaboration with Yonsei University College of Medicine, Quratis and Institut Pasteur. This vaccine strategy has the potential to impact TB control and complement other TB vaccine candidates.

Hepatitis A vaccines are expensive and under-supplied due to their challenging manufacturing process with slow kinetics and low yields SK Bioscience aims to develop a cost-effective hepatitis A virus (HAV) vaccine on a small-footprint, low-cost vaccine manufacturing platform in collaboration with Univercells.

This HAV vaccine will be evaluated in pre-clinical studies for efficacy in relevant animal models, safety, and immunogenicity. Also, the manufacturing process of this vaccine will be integrated, chained and scaled into a low-footprint, micro-facility platform. SK Bioscience has strong product development and renowned cell culture expertise while Univercells has expertise in process design and development of low-footprint and low-cost vaccine manufacturing platforms.

Quadrivalent Meningococcal Conjugate Vaccine eubiologics

Currently available meningococcal conjugate vaccines have drawbacks such as narrow protection range, high prices, or inappropriate formulations like a lyophilized vaccine. EuBiologics is developing a tetravalent meningococcal conjugate vaccine with serogroups of A, C, W-135, and Y conjugated to recombinant CRM197 in a liquid formulation. This vaccine has a high impact on advancement of an affordable and available multivalent meningococcal conjugate vaccine for low- and middle-income countries and supports the Defeating Meningitis by the 2030 initiative set by the World Health Organization (WHO). The scope of work includes evaluating safety, tolerability, and immunogenicity in healthy Korean adults and benchmarking against comparator vaccines

Leishmaniasis RDT Cartridge and Mobile Pocket Analyzer

Early detection and prompt treatment are critical in reducing the 70,000 estimated annual deaths from visceral leishmaniasis (VL). However, timely detection of VL is severely limited due to varying sensitivities and regional biases of currently existing point-of-care (POC) rapid diagnostic tests (RDTs). A more sensitive, non-biased diagnostic test would significantly improve current VL outcomes. BioSquare is working with DNDi (Drugs for Neglected Diseases initiative), CDT-Africa, OptiBio, and Institut Pasteur Korea to develop a POC RDT with high-temperature stability, high-sensitivity and accuracy that can detect human VL with no strain bias, accompanied by a small mobile analyzer with wireless connectivity for use in low-resource settings. The scope of work includes device optimization and production of the antigens for VL.

RIGHT Fund Investment Forum 2019

The RIGHT Fund's first Investment Forum was held on July 17, 2019 in Seoul, Korea. At this forum, the RIGHT Fund announced the list of R&D projects selected through its first Request for Proposal (RFP) and the plan for its second RFP—thereby accelerating its role as a bridge leveraging Korea's innovation and leadership and promoting partnerships with overseas R&D institutions for global public health.

2019 RIGHT FUND INVESTMENT FORUM

2019. 7. 17 (Wed) 09:00~15:00

Sheraton Seoul D Cube City Hotel, Tulip & Rose Room (8F) An audience of abo science companies organizations, and participated in the The RIGHT Fund II partnerships in k discussions of glob First, Katrine T. A management for t Bill & Melinda Gat

An audience of about 100 members from Korean and non-Korean life science companies, research institutions, universities, international organizations, and nonprofit and nongovernmental organizations participated in the forum and the following partnering sessions.

The RIGHT Fund Investment Forum comprised programs to promote partnerships in Korea and overseas, and to encourage deeper discussions of global health among the participants.

First, Katrine T. Andersen, Deputy Director, strategy planning and management for the Tuberculosis and Global Health Strategy of the Bill & Melinda Gates Foundation (BMGF), gave a lecture on "Strategic Collaborations for TB Control & Experience in Global Access".

Next, Ajoy C. Chakrabarti, Portfolio & Platform Lead, Polio, Global Health Program of the BMGF, spoke on the subject of "Innovation in Vaccines and Biopharmaceuticals for Public Health". Mae Shieh, Head of Business Development of the Drugs for Neglected Diseases initiative (DNDi), spoke on the "Role of Incremental Improvements in Global Health". Finally, Joan Herbert, Senior Director of Business Development of the Medicines for Malaria Venture (MMV), delivered a lecture on "Powering Innovation Through Partnerships". Topics discussed included current

areas of focus in TB drug development, innovations in vaccine delivery and lower cost manufacturing platforms.

Presentations from MMV and DNDi highlighted the role of Product **Development Partnerships (PDPs)** and how these organizations work with funders, industry, and academic researchers to impact the lives of patients in low resource settings. The session also included an introductory presentation by Bryan Yeung, Senior Strategy Director of the RIGHT

Fund, on the principles and investment

priorities of the RIGHT Fund.

Bryan Yeung, Senior Strategy Director

that leverage Korean innovation and leadership to solve global health problems, and to promote partnership between Korean industry and foreign R&D institutes, and PDPs. We will continuously try to create more collaboration opportunities, through which we can further address the needs of developing countries."

Chang-Jin Moon, Chairman of the Board of Directors

Chang-Jin Moon, Chairman of the Board of Directors of the RIGHT Fund, stated that "It is of great significance that different areas of health have joined forces to achieve the mission of promoting public health in developing countries. The RIGHT Fund Investment Forum is an event for those interested in our projects. I hope that we can have a meaningful footprint on this foundation."

Younbeen Kim, CEO and Executive Director of the RIGHT Fund, also emphasized that "The RIGHT Fund intends to seek R&D projects

LEADERSHIP

The RIGHT Fund Leadership exerts to advance global health equity by promoting the discovery and development of technologies that will meet the public health needs of developing countries. The RIGHT Fund Leadership team consists of the Board of Directors, Council, Selection Committee, and Management Team. We perform collective and independent roles to come true to our goals.
